

Locked sequence. Wave IDs and their predecessors are fixed. A wave holds steps with no dependency on each other, so everything inside one box starts together. H, F and E all begin after P16, and T01 waits on all three — pulling in Firmware alone does not move the merge. Blue outline = cross-track sync point. Bold + filled = release or closure gate. Step detail sits in Eb-ODM_Master_Process_Flow.xlsx, keyed by the same wave IDs.
